```
The present invention describes an isolated antibody, or an antigence binding antibody fragment (I), that preferentially binds cell-associated to binding antibody fragment (I), that preferentially binds cell-associated CA 125/0772 polypeptide. Also described: (I) a monoclonal antibody (II) produced by hybridoma 487; (2) a monoclonal antibody that competes with binding of (II); (3) a hybridoma or comprising an uncleotide sequence that encodes a variable chain region of (I); (5) a pharmaceutical composition comprising an antibody or an antigen-binding antibody fragment that preferentially binds cell-associated CA 125/0772P polypeptide relative to shed CA 125/0772P polypeptide relative to shed CA 125/0772P polypeptide relative composition comprising a manicolonal antibody or an antigen-binding monoclonal antibody fragment cc that preferentially binds cell-associated CA 125/0772P polypeptide, and a carrier; (6) a pharmaceutical composition comprising an antibody, or an antigen-binding antibody fragment that creferentially binds cell-associated CA 125/0772P relative to shed CA 125/0772P polypeptide, and a carrier; (7) an article comprising an antigen-binding antibody fragment that creferentially binds cell-associated CA 125/0772P relative to shed CA 125/0772P relative to shed CA 125/0772P relative to shed CA 125/0772P or an antibody, or an antibody, or an antibody, or an antibody fragment, which preferentially binds cell-associated CA 125/0772P relative to shed CA 125/0772P or antibody fragment, which preferentially binds cell-associated CA 125/0772P relative to shed CA 125/0772P operably linked to a heterologous composition in a form suitable for administration to a subject; (8) a feature to shed CA 125/0772P operably linked to a heterologous composition of a CA 125/0772P relative to shed CA 125/0772P or an antibody fragment, which preferentially binds cell-associated disorder (10) ameliorating (MI) a symptom of a CA 125/0772P related disorder (10) anellorating (MI) a symptom of a CA 125/0772P related disorder (10)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated antibody, or antigen-binding antibody fragment binding with cell-associated CA 125/0772P polypeptide relative to shed CA 125/0772 polypeptide, useful for ameliorating cervical or ovarian cancer.

antibody fragment; (11) an antibody or antigen binding antibody fragment that competes with (VI); and (12) a pharmaceutical composition comprising (VI) and a carrier. (I) has cytostatic activity, and can be used as an immunetimulant and a mediator of lysis of positive tumour cell. (I) is useful for ameliorating a symptom of a CA 125/O77P-related disorder which is a cell proliferative disorder such as cancer, cervical or uterine cancer, breast or lung cancer or ovarian cancer. (V) is useful diagnostically for monitoring the development or progression of cancer or tumour as part of clinical testing procedure. The present sequence represents the CA 125/O772P 3-repeat amino acid sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           540

This invention relates to polypeptides comprising an immunogenic portion of an ovarian carcinoma protein which acts as an immunostimulant and is cytostatic. The polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polypeptides comprising an immunogenic portion of an ovarian carcinoma protein or its variants, useful for stimulating an immune response in a patient and treating ovarian cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes an isolated polypeptide comprising an immunogenic portion of an ovarian carcinoma protein (or its variants). Ovarian carcinoma proteins, and polynucleotides encoding them, have cytostatic activity and can be used in gene therapy and vaccines. Ovarian carcinoma polypeptides, nucleic acids, antibodies and vaccines are useful for the prevention, diagnosis and treatment of cancer, preferably ovarian cancer. AAA69691 to AAA70077 and AAB12552 to AAB12557 represent human ovarian carcinoma polynucleotides and proteins used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        318 VDLLCTYLQPLSGPGLPIKQVFHELSQQTHGITRLGPYSLDKDSLYLNGYNEPGPDEPPT 377

```
The invention relates to an isolated 0772P polypeptide, which has the structure fully defined in the specification. The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting calls are useful for stimulating an immune response and treating ovarian cancer. Detecting the presence of the polynucleotides and polypeptides is useful for diagnosing cancer. Ovarian carcinoma cDNAs and protein cDNAs were identified using microarray technology. The present sequence represents a human ovarian carcinoma
                                                                                                                                                                                      New isolated O772P polypeptides and polymucleotides, useful in gene therapy, particularly for treating or diagnosing cancer, e.g. ovarian cancer.
                                                                                                                                                                                                                             Example 2; SEQ ID NO 389; 371pp; English

samples, and therefore which patients may be in need of restorative therapy. The host cell may also be used as antigens in the production of antibodies against (II) and in assays to identify modulators of (II)'s expression and activity. The anti-(II) antibodies, agonists and antagonists may be used to regulate expression and activity and as diagnostic agents for detecting the presence of (II) in samples (e.g. be immunoassay). This sequence represents a secreted ovarian carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GVTOLGFYVLDRDSLFINGVAPONLSIRGEVQINFHIVNWNLSNPDFTSSEYITLLRDIQ

                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes nucleic acids (I) and the polypeptides (II) they encode. The nucleic acids (I) may be used for preventing, diagnosing and treating diseases related to their aberrant expression i.e. breast cancers. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (II) by expressing inactive proteins or to supplement the patients own production of (II). Additionally, (I) may be used to produce (II), by inserting (I) into a host cell and culturing the cell to express the protein (II). (I) And its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in

                                                                                                                                                                                                                                                                                                                                                           δ
                                                                                                                                                                                                                                                                                                                                                                                        요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human ovarian carcinoma polypeptides, designated 08E or 0772P, and the polynucleotides encoding them. The invention also relates to methods for inhibiting the development of cancer, e.g. ovarian cancer in a patient, methods for stimulating and/or expanding T cells and methods for identifying secreted tumour antigens. The polypeptides, compositions, antibodies to the polypeptides and methods are useful for diagnosing, preventing, treating and monitoring cancer, e.g. ovarian cancer. The composition is particularly useful for stimulating an immune response in patient. This sequence represents a human ovarian carcinoma polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PTHRSSVSTTSTPGTPTVYLGASKTPASIFGPSAASHLLILFTLNFTITNLRYBENMWPG 137

 the specification, its complement or degenerate variants, or a sequence of at least 20 contiguous residues of the 849 or 1399 bp sequence. The polynucleotides and polypeptides are useful for diagnosing, preventing and treating diseases, such as ovarian cancer, and for eliciting humoral and/or cellular immune response. This sequence corresponds to an ovarian carcinoma antigen protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes an isolated polypeptide comprising an immunogenic portion of an ovarian carcinoma protein (or its variants). Ovarian carcinoma proteins, and polypucleotides encoding them, have cytostatic activity and can be used in gene therapy and vaccines. Ovarian carcinoma polypeptides, nucleic acids, antibodies and vaccines are useful for the prevention, diagnosis and treatment of cancer, preferably ovarian cancer. AAA69691 to AAA70077 and AAB12552 to AAB12557 represent human everain carcinoma polymucleotides and proteins used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                373
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               218

The breast tumour protein DNA sequences may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the breast tumour protein e.g. breast cancer. The present sequence is a human ovarian tumour-derived antigen, which was used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 433
                                                                                                                                                                                                                                                                                                                                                                      218
                                                                                                                                                                                This invention relates to polypeptides comprising an immunogenic portion of an ovarian carcinoma protein which acts as an immunostimulant and is cytostatic. The polypeptides, polymuleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to polypeptides comprising an immunogenic portion of an ovarian carcinoma protein which acts as an immunostimulant and is cytostatic. The polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells that express the polypeptides are useful for stimulating an immune response in a patient and treating ovarian cancer. This sequence represents protein related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GLDREQLYLELSQLTHSITELGPYTLDRDSLYVNGFTHRSSVPTTSTGVVSEBFFTLNFT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptides comprising an immunogenic portion of an ovarian carcinoma protein or its variants, useful for stimulating an immune response in spatient and treating ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SRKFNTTERVLQGLLRPLFRANTSVGPLYSGCRLTLLRPEKDGEATGVDALCTHRPDPTGP

The invention describes an isolated breast cancer polymucleotide (I) comprising a sequence (SI) selected from the 249 mucleotide sequence (CI) fully defined in the specification, complements of SI, a sequence having the comprising at least 20 contiguous residues of SI, a sequence that the specification, complements of SI, ander moderately stringent conditions, a sequence having at least 75%, preferably 90% identity to SI, or degenerate variants of SI. Also described are: an isolated polypeptide (II) encoded by (I), or expression vector (III); a host cell (IV) transformed or transfected with certain isolated antibody (Ab) that specifically binds to (II); an isolated antibody (Ab) that specifically binds to (II); detecting (MI) the presence of cancer in a patient; a fusion protein (V) comprising (III); an oligonucleotide (VI) that hybridies to SI; detecting (MI) the presence of cancer in a patient. (CI) is an inhibiting (MI) the development, and a second component selected from (II), (III) and antispon presenting cells that express (III); and inhibiting (MI) the development of a cancer in a patient. (VI) is an eaful for determining the presence of cancer in a patient, by obtaining a biological sample from the patient, or or and inhibiting cells that bind to the antibody that binds to OBE, isolating cells that bind to the antibody that binds to OBE, isolating polymucleotides with (VI), is useful for the oligomucleotide, and comparing the amount of polymucleotides with (VI), is useful in the design and preparation of ribozyme cut-off value, and thus determining the presence of cancer in the presence of cancer in the development of breast cancer. (C) is useful for inhibiting the development of breast cancer in a patient, and for removing twour cells from a biological sample of the tumour polypeptides and cut-off value, and thus determining the presence of cancer in the presence of cancer in the presence of cancer in a patient. (I) is useful for detecting the presence of cancer in a patient. (I) is useful for detecti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             254 VDLLCTYLQPLSGPGLPIKQVFHELSQQTHGITRLGPYSLDKDSLYLNGYNEPGPDEPPT 313

The invention describes an isolated breast cancer polynucleotide (I) comprising a sequence (SI) selected from the 249 nucleotide sequences

```
cully defined in the specification, complements of S1, a sequence

comprising at least 20 contiguous residues of S1, a sequence that

thybridize to S1, under moderately stringent conditions, a sequence having

at least 75*, preferably 90* identity to S1, or degenerate variants of

S1. Also described are: an isolated polypeptide (IT) comprising a

sequence (S2) selected from any one of the 11 sequences mentioned in the

S1. Also described are: an isolated polypeptide (IT) comprising a

comprising (I), operably linked to an expression control sequence; a host

CC omprising (I), operably linked to an expression control sequence; a

comprising (II); an oligonacleotide (VI) that hybridizes to S1;

detecting (MI) the presence of cancer in a patient, a fusion protein (VI)

comprising (II); an oligonacleotide (VI) that hybridizes to S1;

comprising (II); an oligonacleotide (VI) that hybridizes to S1;

stimulating and/or expanding (M2) T cells specific for a tunor protein;

comprising (II); an oligonacleotide (VI) that hybridizes to S1;

stimulating and/or expanding (M2) T cells specific for a tunor protein;

comprising (II); an oligonacleotide (VI) that hybridizes to S1;

a diagnostic Kit (VIII) comprising T cells prepared by (M2);

a composition (C) comprising physiologically acceptable carriers and

funnomerimilating as first component, and a second component cell

comprising a reporter group; and inhibiting (M3) the development of a

comprising a reporter group; and inhibiting (M3) the development of a

comprising a reporter group; and inhibiting (M3) the development of a

comprising a patient, by incubating CD4 and/or CD6;

conter in a patient, by incubating the development of a cancer in the patient. The following are disclosed;

compositions comprising and research of cancer in a patient. (I) is useful for tending the development of a cancer in a patient, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    518

                                                                                                                                                                        613
                                                                                                                                                                                                     758
                                                                                                                                                                                                                                    673
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated 0772P polypeptide, which has the structure fully defined in the specification. The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-calls or antigen presenting cells are useful for stimulating an immune response

```
The invention describes nucleic acids (I) and the polypeptides (II) they encode. The nucleic acids (I) may be used for preventing, diagnosing and treating diseases related to their aberrant expression i.e. breast

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated 0772P polypeptide, which has the structure fully defined in the specification. The composition containing the polypeptides, polynucleotides, fusion proteins, antibodies, T-cells or antigen presenting cells are useful for stimulating an immune response and treating ovarian cancer. Detecting the presence of the polynucleotides and polypeptides is useful for disgnosing cancer. Ovarian carcinoma cDNAs and protein cDNAs were identified using microarray technology. The present sequence represents a human ovarian carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SRKFNTTERVLQGLLRPLFKNTSVGPLYSGCRLTLLRPEKDGEATGVDAICTHRPDPTGP 133

cancers. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (II) by expressing inactive proteins or to supplement the patients own production of (II). Additionally, (I) may be used to produce (II), by inserting (I) into a complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in camples, and therefore which patients may be in need of restorative therapy. The host call may also be used as antigens in the production of antibodies against (II) and in assays to identify modulators of (II)'s expression and activity. The anti-(II) antibodies, agonists and activity. The anti-(II) antibodies, agonists and all and activity and as antigen in and activity and as expression and activity and as contain and activity and as a diagnostic agents for detecting the presence of (II) in samples (e.g. by antibodies).

Example 2; SEQ ID NO 312; 399pp; English.

The invention describes nucleic acids (I) and the polypeptides (II) they encode. The nucleic acids (I) may be used for preventing, diagnosing and creates are seasons related to their aberrant expression i.e. breast cancers. For example, (I) and (II) may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a partient's genome that affect the activity of (II) by expressing inactive proteins or to supplement the patients own production of (II). Additionally, (I) may be used to produce (II), by inserting (I) into a Additionally, (I) may be used to produce (II), by inserting (I) into a complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in easily. The host cell may also be used as antigens in the production of antibodies against (II) and in assays to identify modulators of (II)'s expression and activity. The anti-(II) antibodies, gaonists and assays to require expression and activity and as antigenestic agents for detecting the presence of (II) in samples (e.g. by immunoassay). This sequence represents a secreted ovarian carcinoma

The invention relates to human ovarian carcinoma polypeptides, designated OBE or 0772P, and the polymucleotides encoding them. The invention also relates to methods for inhibiting the development of cancer, e.g. ovarian cancer in a patient, methods for stimulating and/or expanding T cells and methods for identifying secreted tumour antigens. The polypeptides, compositions, antibodies to the polypeptides and methods are useful for diagnosing, preventing, treating and monitoring cancer, e.g. ovarian cancer. The composition is particularly useful for stimulating an immune response in patient. This sequence represents a human ovarian carcinoma polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DKVTTLYKGSQLHDTFRFCLVTNLTMDSVLVTVKALFSSNLDPSLVEQVFLDKTLNASFH

The present invention relates to polymucleotide and polypeptide sequences associated with breast cancer. Also disclosed are expression vectors comprising the polymucleotide sequences of the invention operably linked to an expression control sequence, host cells comprising the vector, antibodies (or antigen binding fragments of antibodies) specifically, binding the polypeptides of the invention, fusion proteins comprising at least one of the polypeptides, stimulating and/or expanding T cells specific for a tumour protein. The polymucleotide sequences, polypeptide specific for a tumour protein. The polymucleotide sequences, polypeptide specific for a tumour protein. The polymucleotide sequences, polypeptide therapeutically/prophlactically to induce an immune response. They can be included with a physiological carrier/immunostimulant in compositions such as vaccines, particularly to treat or prevent cancers such as breast cancer. They can also be used to inhibit the development of cancer by incubating one or more of them with CD4+ and/or CD8+ T cells isolated from a patient, such that the T cells proliferate, and administering the producing one or more of them with CD4+ and/or CD8+ T cells isolated from a patient, such that the T cells proliferate, and administering the useful for detecting cancer in a patient, producing fusion proteins, producing T cell populations and antigen presenting cells. The present sequence represents a polypeptide sequence of the invention.
                                          818
                                                                                                                                                                                                                                                                                                                                                                                          Human, breast cancer; T cell; tumour protein; antigen presenting cell;
immune response; CD4+; CD8+; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotides, useful for treating and diagnosing cancer, particularly breast cancer by stimulating immune response in a patient and inhibiting the development of cancer.
